

## VxCloud Broadband

ADSL, LTE and Wireless networking connectivity is perfectly suited for customers that require fast Internet connectivity and branch office deployments. We provides clients with Public IP's and Cloud VPN solutions for utilization of networking technologies to create secure remote branch offices. For as reduced price we are now able to provide small to medium enterprise clients with highly available networks that previously were only accessible by large business enterprises.

The disadvantage of ADSL is its lack of stability resulting in clients often finding it difficult to maintain a stable network service in comparison to MPLS and newer fibre networking services. ADSL and LTE can also combined to supplement current networking links and increase bandwidth and high availability. Best use cases for ADSL, LTE and Wireless Broadband includes branch office internet, fast internet access, Cloud VPN and Cloud Service Provider networking.
