

## VxCloud VxCloud VoIP

VxCloud provides more than just VoIP. The main focus point of the voice solutions is also to resolve the issues of VoIP bandwidth and QoS (Quality of Service). The VxCloud Cloud VoIP networking services utilizes all types of networks including LTE, FTTH, Broadband, ADSL, Fibre and Others to create the perfect combination of networking and voice services.

For the first time it is possible to create a cost effective ratio between VoIP and bandwidth required to support quality Voice. VxCloud provides monitoring and secure communication to clients and integrated VoIP services such as call quality and security.

VxCloud network and VxCloud Voice is designed towards stability and provides additional routes and SIP trunks to create redundancy. VxCloud will migrate and manage the client's telephone environment with ease through remote management and hardware such as Polycom and Yealink.

VxCloud solutions are unique in that the end-to-end VoIP telephony services and provided including hardware and onsite support.

With VxCloud VoIP you can trust the SD-WAN network to keep you connected at all times with automated failover and QoS. Clients can benefit from VoIP with a dedicated technology driven company committed to product and service excellence.

Some of the important Voice of IP benefits:

- VoIP is a huge cost saver if the network is included (Such is the case with VxCloud Voice)
- Number portability is quick and easy
- Large range of numbers are provided to clients
- There is no geographical boundaries (Now also including LTE and 3G with Automated Failover and QoS)
- Excellent features such as voicemail to email transcription and conference calling can be set up easily

## VxCloud Cloud – VoIP Cloud Networking Services

The ratio between bandwidth and VoIP is finally achieved with the VxCloud Cloud Hosted network.

### VoIP Quality Improvements

**Automatic application recognition and categorization**

- Deep packet inspection
- Cached recognition for first packet steering
