

VxCloud Internet

VxCloud Internet provides complete enterprise quality internet services and includes internet breakout services in CPT, KZN and Gauteng. Internet is commissioned to clients at a lower wholesale cost. VxCloud internet is usually used in conjunction with point to point network internet breakouts. Internet access is scalable and provides access to different internet quality levels from 1:1 up to 1:10 contended internet traffic.

The advantage of using VxCloud Internet Points of Presence (POP) is that it also provides access to internet exchange points. An internet exchange point is where the sharing of information between service providers occurs and allows us to provide free access to content and cloud services. Services include dedicated data centre internet traffic from 2 Mb to as much as 1 GB uncapped unshaped internet traffic.
